

Seagate Technology (Tank Clean) Case Study

Precision provide a range of services to Seagate Technology, a recent example is a 38,000-litre diesel tank that Seagate required de-gassing and cleaning.

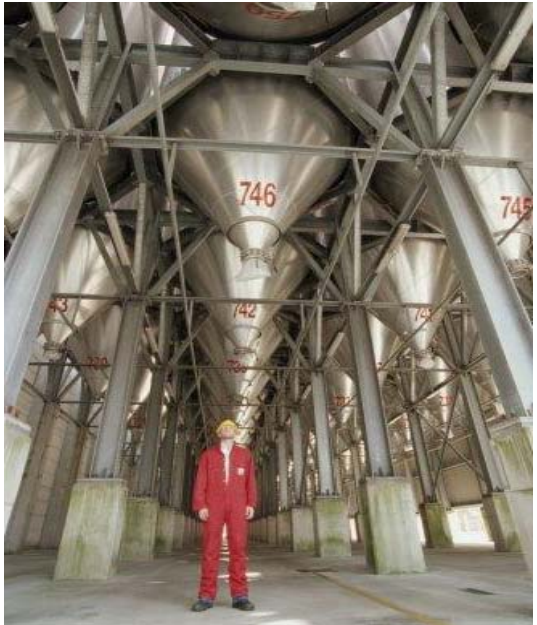

The tank held unique challenges regarding entry as pipe work and other infrastructure meant access was top entry and very limited.

The Precision project team drew up a risk assessment and method statement with Seagate Technology, which included a rescue and emergency plan. Precision were the only organisation that could meet the rigours safety and quality standards demanded by this global payer.

The project team began with a full survey being conducted, which confirmed that the sludge was feet thick and would require special cleaning with TFR.

The project was completed very successfully on time without any incident and Seagate Technology were delighted with the result, which meant production operations could continue unhindered.
